\* \*\*Draw:\*\* Draw new graphics (add lines, circles, shapes, or text) directly on photos or layered graphics. Drawing with Photoshop enables you to add shapes, move them around, and even change their colors and effects. Illustrator (not to be confused with Adobe Illustrator), for example, is a graphics application that works in a different way. Illustrator enables you to draw vectors (static objects such as lines or shapes that can be scaled up and down without distorting). \* \*\*Move and resize:\*\* You can move and resize objects on the Canvas by simply clicking and dragging the object. You can also move and resize objects on the Layer Stack by simply clicking on the object and dragging it in any direction. \* \*\*Filter and effects:\*\* You can apply various effects to photos, like brightness, contrast, and color correction. The Filters work with all the Elements in Canvas, and you can apply them to individual graphics, text, shapes, and so on. \* \*\*Layer:\*\* You can create a new layer, duplicate it, or insert another image as a new layer. Each layer has a unique color or tint and then is used to create a different effect in the photo. You can have as many layers as you want. \* \*\*Blend modes:\*\* You can blend two images together to create an all-new image. You can create a black-and-white image, add some color, or even create a cloud-like effect that simulates the appearance of light coming off a shaded tree. \* \*\*Select and mask:\*\* You can select an area of an image and then apply a mask that provides you with the option of erasing a selected area from the photo. \* \*\*Adjust:\*\* You can change the brightness, contrast, and colors of a photo so it's brighter or has more contrast. You can also create a photo that's just a bit darker and add a tint to the colors in a photo. The Adjust menu is a special place for adjusting color, contrast, and brightness. You can easily see just how much of an effect your changes have by the way the image looks. You can make a single image by combining multiple layers of graphics. Your layers are arranged on the Layer Stack. It's great for when you have more than one image that you want to apply an effect to. Each image is part of the same image.

[Observation of anti-inflammatory effect of pentazocine (k-335) in canine olecranon bursitis]. The anti-inflammatory effect of a new compound pentazocine (k-335) was evaluated in a canine model. Pentazocine (5 mg/kg) was intramuscularly injected into the olecranon bursa of 6 experimental dogs twice daily for 14 days. The area of olecranon bursa of the treated group was significantly smaller than that of the control group. Although the plasma level of prostaglandin E2 in the treated group was slightly lower than that of the control group, the plasma level of prostaglandin E2 in the treated group was only slightly lower than that of the control group. The plasma level of thromboxane B2 in the treated group was significantly lower than that of the control group. The results indicate that pentazocine has a favorable anti-inflammatory effect in the treatment of canine olecranon bursitis.

Before we jump into the code, we need a few building objects:

1. Field of the Invention The present invention relates to measurement of antibody bound antigen in biological samples. More specifically, the present invention relates to a method and apparatus for separating bound antigen from free antigen in biological samples using a solid substrate coated with a capture antibody. 2. Description of Related Art Antibody is capable of selectively binding to a particular antigen or hapten, thereby forming a complex having physical and chemical characteristics similar to the antigen or hapten. Antibodies are typically produced by an immune system in response to an invasion or infection by a microorganism. Antibodies are produced by B-cells, which are antibody producing lymphocytes. Antibodies are made by B-cells when they become activated by a microorganism that has invaded the host. Each B-cell has a particular antibody "repertoire" and tends to make the same type of antibody. In a healthy immune system, B-cells and antibody production is controlled by antigen-presenting cells (APC). These cells present the antigen to T-cells, which act as coordinating cells in the immune system. If the antigen-presenting cell is an antigen-producing cell, it presents the antigen to the T-cells, which act as signal-givers and tell the B-cells which antibodies to produce. Antigen-presenting cells can also produce interleukins which stimulate the B-cells, thereby increasing the number of B-cells present to produce additional antibodies. Antibodies are readily distinguishable from other molecules by their physicochemical characteristics, e.g., size, electrical charge, etc. Antibodies vary in size according to their respective classes and subclasses. IgA antibodies,

for example, range in size from 18 to 25 nm and IgE antibodies are known to range in size from 50-75 nm. A combination of antigen and antibody is generally referred to as a "complex" or "immunocomplex." Complexes generally are very unstable. Antibodies generally quickly dissociate from their antigens or vice versa. Complexes are also typically disordered and large. This instability and disorder may be due to the fact that antibodies and their antigens must fit together in order to produce a complex. Antibodies frequently bind to the same antigens in various combinations. For example, antibodies that detect bacterial capsular antigen tend to detect all capsular antigens within a particular class or subclass. Antibodies, therefore,
