Direct modeling Direct modeling is the ability to use an HTML5 web browser and/or a mobile device to create an onscreen representation of a real-world object, without the need of a CAD program. This is done by taking a picture or video of the real-world object, either by webcam, cellular device camera, or through the use of 3D-printed models. The software then digitally re-creates the object and has the ability to easily manipulate the object by dragging, rotating, scaling, and moving it around on the screen. This modeling is mainly used for rapid prototyping and as an educational tool. The software does not allow for in-depth editing capabilities, although it does support basic snapping functionality. The software also has the ability to import various formats, such as STL, STLZ, CAD, XML, DXF, DWG, DGN, SKP, and Visio. Also, thanks to the creation of the original Autodesk Exchange Apps, some of these applications can be used in addition to the ability to import 3D models. The software is available for desktop Windows and Mac and mobile iOS and Android devices. Creation Among the major features of AutoCAD, the ability to create multiple views, parameters, and various drawings and drawings components are important features. Go To command One of the most useful features of AutoCAD is its ability to navigate through a drawing by a simple drag-and-drop action: the Go To command. The drawing in a drawing space (a view) can be navigated to by dragging the mouse to a coordinate in a drawing space. Once the mouse is near a coordinate, a double click on the mouse will place a window on the coordinate and change the current drawing space to the coordinate. Holding the shift key while dragging will move the window to the last known location in a non-moving fashion. This operation can be automated in the Application Menu → Options → Navigation → Go To menu: this way, a sequence of actions (dragging to one coordinate and double clicking on it) can be performed with a single mouse click. This may be useful in repetitive actions (pasting in a series of a same element on a same drawing space). The Go To command is used extensively in the drawing environment. In addition to navigating through the drawing space (view), the command is used

to navigate through a drawing to its different drawing objects (elements). The Go 5b5f913d15

Technical Field The present disclosure relates to a surgical clip applier and, more particularly, to an articulating surgical instrument for applying surgical clips to body tissue. II. Background of Related Art Surgical instruments and devices such as surgical fasteners are often applied to body tissue with significant force to join and close the tissue together. In many instances, the target tissue must be joined while the surgeon is viewing the tissue through a scope or other surgical viewing device. This makes the application of the fastener challenging. For example, the surgeon often has trouble holding the instrument steady to apply the fastener because the instrument is often vibrating and moving during application of the fastener.The present invention relates to a scissor-type clamping tool for clamping and cutting a workpiece, e.g., a workpiece for forming a window pane for a vehicle and, more particularly, to a scissor-type clamping tool suitable for cutting the entire periphery of a window pane with a single tool. In order to increase the convenience of cutting a workpiece, a scissor-type clamping tool having a pair of opposing legs with clamping members mounted thereon is known in the art. The tool is operated in such a manner that, when the clamping members are pressed towards each other, a clamping space is formed between the clamping members and the workpiece, and that the work
