1.Q: Mockito: what are the differences between two annotations? What is the difference between: `@Test public void tester() {` and `@Test void tester() {` Is the former annotation useful only if you're testing a method of one class? If so, what's the point of it? A: The former is for interfaces, the latter for classes. You can use the latter to mock a method and test it, when your mock will be used as a member of a mock instance and you'll be able to check the invocations performed by the mock as you would normally expect it to be the case when testing the class that uses it. For example, you'll be able to call `tester()` in your test, check that it got called, then check the actual invocation performed by the mock as well (accessing the

mocked method args). If you do so, the real users of that person will report to Twitter. Twitter takes the real account owner very
