KeyMacro lets you assign macros to keys, which means you can set actions you want to occur when pressing those keys. This can include things such as opening a certain program, browsing a particular folder or file, or opening a web browser to access a specific website. Installing KeyMacro: First, you will need to download a small application that runs in the background. This application has a few more functions than KeyMacro, but is necessary to install and run it. Once that's done, it's time to install KeyMacro. You can either go through the.exe file, or use the installer included with the downloaded file. Either way, be sure to click through the license agreement. After that, it's just a matter of running the program and creating a new KeyMacro. First, set which key you want the action to be performed on, and type the actions that you want to happen. KeyMacro will do the rest for you. You can assign any of the functions that can be performed by the keyboard to the Macro, and the program will go through and analyze the keyboard layout to make sure it is accurately assigned to the key. To remove an action, simply type it in the list of Macro functions, and it will be marked as removed. Alternatively, you can just highlight one and press Delete, and it will be marked as deleted. KeyMacro can also be saved to the Windows Registry. This means it can be loaded at any time, and all functions and key assignments will be saved. Why would you want to use KeyMacro: If you plan to do any programming, you might be interested in using KeyMacro as a keystroke recorder. To do this, simply enable it from the settings menu, and go through a series of functions that you want to record. Any keystrokes you make while the program is running will be recorded. After you have finished, simply go to the settings menu, and the macros will be saved to the.txt file. You can also use the recorded macros to open files, open programs, or whatever else you might be interested in doing. KEYMACRO's features: KeyMacro has tons of different actions that you can assign to the keyboard, and it also has the ability to be saved to the Windows Registry, which will allow you to load the macros later on. For a full list of features, you can read the manual,

MouseTool is a very complete utility, providing great functionality for most common mouse actions. It is designed to be a single-window tool, and that is a fundamental part of the package. It is currently written in classic C++, which does not require any additional setup. Although not necessarily an issue, it's worth noting that MouseTool is not considered cross-platform or open source. The mouse tool for Windows provides several tabs, each with their own purpose. The most prominent feature, that of playing a sound, takes up the entire window. There is a slider to adjust volume in the first tab, while the second one is reserved for playing/pausing, and the last for playing multiple sounds. In the "sounds" tab, the audio is available in .wav, .mp3, and .ogg formats. There is also the possibility to play .mp3 or .ogg sounds by entering the entire file path. In the middle of the window is a playlist editor, where you can add and delete songs from a file saved in .pls format. It's actually very easy to set up, just click on the Create button to get started. There is one last tab, which is for the actual creation of the sounds. After opening, the window is similar to a very basic sound editor, which lets you edit the parameters of the track and save them to a file. You can save all the changes made in the editor, and even load them, but a lot of this is actually read only. It's much more likely that you'll want to load a file from a playlist in order to get started, but no sound will be played until the proper settings are loaded. There are also other buttons to make playing sounds easier. Right clicking on a track opens up a menu to play it, while clicking the audio icon on the far right will open up a volume slider. There is also a format button which has the effect of converting any sound to the currently selected format. MouseTool contains several features which are not designed to be a mouse tool. An audio file can be played using keyboard shortcuts, and there is an option to loop the tracks at the end of a playlist. Additionally, there is the option to play a sound once, or loop it indefinitely. MouseTool Description: MouseTool is a very complete utility, providing great functionality for most common mouse actions. It is designed to be a single-window tool, and that
