The game is a hack of Champions of Norrath and Champions of Fate. The base follows the same game mechanic and player interaction. About Thora: The game is a hack of Champions of Tali and Champions of Fate. All the mechanics from both games are present, such as the Blue Hell, magical artifacts, and character development. The interface, characters, and story are completely original, as are all the physical world locations. About the IP: Champions of Thora and Champions of Thora: Defenders of Terra share the same IP. This allows us to use the Champions of Thora engine for all three games.

Hydrophilic surface properties of porous silicon optical waveguides. For developing optical waveguides for biological and chemical applications, one of the most attractive features is that silicon is highly biocompatible. However, when silicon is exposed to hydrophilic surfaces such as proteins, water undergoes a phase change and the silicon surface acquires hydrophobicity. Recently, a porous silicon optical waveguide, which can be used to effectively confine visible and near-infrared light, has been fabricated by anodic etching in a HF solution. Here, the surface properties of porous silicon are compared to those of glass and silicon. Although the silicon surface was slightly hydrophobic to the extent that water droplets adhere, the surface became hydrophilic upon exposure to aqueous solutions. The surface modification of porous silicon with polydopamine, a polycation from mussel byssus adhesion, made the silicon surface hydrophilic without causing any problems. This change of surface properties enables porous silicon optical waveguides to be used as a platform for bottom-up integration of microfluidic systems.

Return to the machine-tampering water theme of past titles and join in on the latest adventure! The mayor of Tivoli Town has a problem. While the waterside city is newly rebuilt, it has a rogue Machineer running around, and the Mayor knows she won't stop until the town is back in the water again! In this fun, festive title, join in on the mayor's investigation and help stop the Machineer and restore peace and order to the city. The citizens of Tivoli Town were tired of the way everything had been thrown upside down, so they decided to have it all put back the way it was. What could go wrong? A lot, of course. The Mayor has a problem: a machine has been found in the river, and it is not one that anyone can fix. Why doesn't anyone know about it? When you hear some new sounds in the river that no one can explain, you know where to look... After all, you can tell the difference between normal sounds and the strange ones. Maybe you can solve the mystery and shut down the rogue machine in River City. Life in Tivoli Town has changed. There are

new water-themed machines in the workshop, and new shops have come to town. There's even a new Zola, who may not be quite as easy to please as the last one.

This is the fourth title in the Zola series, and now you can use the new tools provided to go back to the water theme. Plus, the residents of Tivoli Town are missing something — you can find out what that is and bring back the things they've lost. This is an Arcade-like RPG with items, characters and machines. - Build your own boats, including oars, sails, and a fully automated steering wheel! - There's a new boat with AI control! It's fun to steer it around in the water! - There are machines and shops to interact with! - There are new characters and events to discover! - There are puzzles that need solving!

**Interstate Drifter 1999 A Field Guide to Ultimate Frisbee
2010 Eric Wolf Extreme Sports Publishing, 2009 Ultimate Frisbee is to me like the aromatics to fine wine: something your ears, nose and tongue are about to taste in its pure, untamed nirvana. It's a game that, once tasted, never really leaves you. The initial wave of excitement quickly gives way to a second, deeper swirl, evoking optimism and a craving for self-renewal. Always spiced and energized by competition, the game is in constant flux. It was created by Deke Stubbs with a wood roller in 1965, evolved and stuck around in college dorms and parks just before Daniel Brook's tennis-court colonoscopic epiphany of 1978, and never lost its unique identity. Perhaps that's what attracts so many players to the sport: The challenge of playing an unpredictable game with an unpredictable team of wacky personalities. In fact, that's all it takes to set it apart: unpredictability. If it were played any other way, it would be boring and/or annoying. Consider for a moment that I, an 33-year-old adult male twice divorced with dependent children living in the Lower Bronx, have followed Ultimate Frisbee most of my life and maintain my personal passion for the sport despite never going to college, and you'll understand that the game has captured something in me that I've never felt for any team sport. I began playing Ultimate with my good friend Andy Mee and a few dozen other kids in the South Bronx in 1993. I fell in love with the game fast, and joined a team named Moondog Rules. From there, the sport grew and was taken to colleges around New York state, and then the sport spread the world. Suddenly, everyone was playing Ultimate—all different skillsets, ethnicities and lifestyles as disparate as grand mal seizures and panic attacks. I remember buying my first Frisbee with my first paycheck after finding out that I was a beneficiary in my ex-wife's will; around the same time, Mee bought his own. For a time, we became devotees of the Atomic Split-finger Pick-Pass, the game's greatest innovation. But even the basics of the sport changed, and we quickly faced great new challenges trying to follow it all. At the same time, I attended my first beer festival, and**

was hooked on the future.

1. Field of the Invention The present invention relates to a liquid developer used for developing latent electrostatic images in electrophotography, electrostatic recording and the like, particularly a contact or no-contact type liquid developer used for developing latent electrostatic images in an electrophotography method.

2. Discussion of the Background Electrophotographic method is commonly used for image formation in electrophotographic apparatus. In this method, an electrostatic latent image is formed on a photoconductive material, the latent image is developed using a developer containing a coloring agent such as a pigment or dye, the developed image is then transferred onto a recording medium such as paper, and the image is fixed on the recording medium by application of heat, pressure or solvent vapor. Generally, carbon black is used as the coloring agent in the developer, and optionally a resin or a wax is incorporated in the developer for the purpose of improving the dispersibility of the coloring agent. In recent years, a contact or no-contact type liquid developer is widely used to ensure high image quality. In this kind of liquid developer, high image quality is obtained, but only small amounts of the developer are required, and there is a possibility of leakage of the developer. To reduce this possibility of leakage, a fluorine-based polymer or resin, alkyl group-containing resin, and the like is incorporated into the developer to improve its dispersibility and leakage preventing ability. To increase the fixability of the developer, waxes are incorporated into the developer, but a problem still remains that the waxes tend to segregate or separate from the developer, causing blurring of
