What's New In?

The Intel Media SDK is a powerful development package that comprises all the necessary tools and components to help programmers create applications for multiple platforms and devices. The toolset also includes samples and comprehensive documentation to assist developers and make the media acceleration capabilities of Intel's platform available to everyone. The Intel Media SDK 2012 R3 software development kit (SDK) for Android offers the following capabilities:

- Device Profile Overview: The Intel Media SDK can take into consideration the following three components of the Media SDK for Android: the Media Driver, the Intel Media Services, and the Intel Media SDK Host to capture media streams to the Media Driver, and playback media streams from the Media Driver. Each component has its own configuration files for a particular platform configuration.
- Media Streaming Features: The Media SDK for Android allows developers to build media applications using a number of new features. This includes access to the Core Audio APIs for media processing, as well as Intel's own hardware codecs such as the H.264 and H.265. The new features are comprised of three groups: * Media Resolvers and Source Resolvers * Media Processing APIs * Media Interface APIs * Media Processing Codecs * Media Applications: The Media SDK for Android provides a number of media applications that can be used to demonstrate the new features. The Media Streaming capabilities of the SDK are provided through two major classes: the MediaPlayer class and the MediaResolver class.
- MediaPlayer: The MediaPlayer object is a generic class that enables an application to handle media. An application can create a MediaPlayer object in the following ways: - Create an instance of the MediaPlayer class with the MEDIAPLAYER_CREATE flag. - Create an instance of the MediaPlayer class with the MEDIAPLAYER_NEW flag. - Create a MediaPlayer object in an already created activity.
- MediaResolver: The MediaResolver class defines the media resolver architecture, which identifies the media resources that are available and serves them to the application using the appropriate Codec and MediaInterface classes. MediaResolver functions are invoked when the application needs to use media. Each resolver object has a corresponding MediaResolverInterface, which holds the information about the current resolver, and provides a common API to access the various media resources. The MediaResolver class provides two functions to create a MediaResolver. One creates a MediaResolver with the MEDIARESOLVER_CREATE flag, and the other creates a MediaResolver with the MEDIARESOLVER_NEW flag. Media Streaming Features: The Media SDK for Android offers a number of new features. Some of the new features include: Media Player * MediaPlayer class: The MediaPlayer class is a generic class that enables an application to handle media. The application can create a Media
