Magnetic memories, such as, for example, a magnetic random access memory (MRAM), have gained considerable attention as an information storage device with a high storage capacity and a high recording density. A conventional MRAM is disclosed in U.S. Pat. No. 6,215,713 and U.S. Pat. No. 6,307,934. This conventional MRAM is configured with non-magnetic metal materials and ferromagnetic materials. The non-magnetic metal materials are used as current paths and the ferromagnetic materials are used as information-storing layers. In this conventional MRAM, although magnetic moments of the ferromagnetic materials to be formed in the information-storing layers are fixed by exchanging them with laminated antiferromagnetic layers, the magnetic moments of the ferromagnetic materials can be easily inverted by applying a magnetic field. An information-storing layer in which the magnetic moments of the ferromagnetic materials are inversely inverted is provided with a magnetoresistive effect. With respect to this information storage device, all of the ferromagnetic materials used in the conventional MRAM are generally in polycrystalline states. Therefore, grain boundaries are relatively small, and the magnetic moments are in uniform directions. In addition, the laminated antiferromagnetic layers are used in order to fix the directions of the magnetic moments. Therefore, the above-described information storage device has relatively large magnetic anisotropy energy (Ku) as compared to the case of amorphous magnetic materials. As a result, an information storage device with a large storage capacity and a high recording density can not be realized. With regard to a conventional MRAM, Japanese Laid-Open Patent Publication No. 8-138121 discloses a synthetic ferrimagnetic material in which the magnetic moments are in directions opposite to each other in a magnetic multilayer film with a granular structure. However, the synthetic ferrim
