First, you'll need to download and install the software on your computer. Then, you need to locate the installation.exe file and run it. Once the installation is complete, you need to locate the patch file and copy it to your computer. Not sure, really, why this should be better than the BICDRA version that I've used before. I find it easier for photographs, it is slower in architectural drawings (no transparency effects, indexed layers, filters etc.), but maybe it would be better for the drawings I work on...

I'm fairly new to BICDRA, having adhered to it only since I downloaded LR3.4.4 for review. I used to use Adobe's Color (preset) Manager for earlier version. This new version has a couple of very interesting features.

Overall, we saw a strong positive response to the creative cloud initiative. Our customers clearly see and appreciate the ability to access and share files across all of their applications. However, the initial release did not live up to the vision for the creative cloud. We needed to give people more time to really understand the service and how it would work. We are now letting users download and begin testing the creative cloud beta now, so they can begin to get the most out of the creative cloud, and provide feedback that will inform the final release. If non-linear editing has been your line of work, you must have worked on a lot of projects. And one of the most irritating aspects of digital is that hours of work has to be copied even for a single project in another computer. You need to remember all the captured frames, all the settings, and most importantly, the selected filters and textures. To save time, most of us have started using plugins. But the problem with these plugins is that editing is not fun. You need to remember that you have copied all the frames, so be careful to insert the frame you want. Often it means remaking a selection that you already made. Sometimes while making a frame, you come back to the original frame, but only to erase the frame you just made, but that frame seems to be recorded, and deleted. In that case, to save the frame, you need to rewind to the beginning, and then come back again to delete the frame.

Newton OS X may have already solved this problem – in a new screenshot posted on

Twitter, in a process very similar to the iOS Photos app.
